

1. What is a for loop?

Answer:

- Used when the number of iterations is known.
- Iterates over a sequence.
- Easy to use.

Example:

```
for i in range(5):  
    print(i)
```

2. What is a while loop?

Answer:

- Runs while a condition is True.
 - Stops when the condition becomes False.
 - Used when iterations are unknown.
-

3. What is the difference between for and while loop?

Answer:

- `for` loop → Known number of iterations.
 - `while` loop → Depends on a condition.
 - `for` is simpler for sequences.
 - `while` is useful for continuous checking.
-

4. What is break?

Answer:

- Stops the loop immediately.
 - Exits from the loop.
 - Used with `for` and `while` loops.
-

5. What is continue?

Answer:

- Skips the current iteration.
- Moves to the next iteration.
- Does not stop the loop.
