

# 1. What is the return statement?

**Answer:**

- Returns a value from a function.
  - Ends the function execution.
  - Sends the result back to the caller.
- 

# 2. What is the difference between print() and return()?

**Answer:**

- `print()` displays output.
  - `return()` sends a value back.
  - `return()` can be used later in the program.
- 

# 3. What are built-in functions?

**Answer:**

- Functions already available in Python.
  - No need to create them.
  - Examples:
    - `print()`
    - `input()`
    - `len()`
    - `type()`
    - `range()`
- 

# 4. What is len()?

**Answer:**

- Returns the length.
  - Works with strings, lists, tuples, and dictionaries.
  - Returns the number of elements.
-

## 5. What is range()?

**Answer:**

- Generates a sequence of numbers.
- Mostly used in `for` loops.
- Can define start, stop, and step values.
